Solid State Physics - Physics & Astronomy - and the third gives a diamagnetic contribution. In the ground state of the hydrogen atom the orbital moment is zero, and the magnetic moment is that of the electron spin along with a small induced diamagnetic moment. In the 1s state of helium the spin and orbital moments are both zero, and there is only an induced moment.

What happens if we add one proton or H^+ to the system which is R away. The potential energy for the electron is then $U(r) = \sum_j e^2 / r_j - \sum_j e^2 / R_j$ (10) The lowest eigenfunction with eigenvalue -13.6 eV is $\psi(r) = 1/\pi a_0^3 e^{-r/a_0}$ (11) where a_0 is the Bohr radius. But now we have two protons.
